Outline

What is shaping change in Southern CA forests?

What will Southern CA forests contain in 2114?

Current and future concerns???

- Climate Change
- Drought
- Fire
- Laurel wilt
- Insects from Mexico?
- Lack of resources to care for land; politics

Threats

Drought

Fire

Water Diversion

Development. Urban encroachment.

Recreation over use. Off-road vehicles. Tourism. Recreational shooting areas. Drug manufacturing.

Grazing

Oil and gas drilling. Mining

Poor vegetation management

Air pollution

Lack of care for species valued by tribes

Photos: Los Padres Forest Watch, Popular Mechanics

Threatened and Endangered Species

- 76 federally listed threatened & endangered species in the 4 Southern CA National Forests.

- 405 at-risk species

San Joaquin kit fox, Smith's blue butterfly,
California spotted owl, bald eagle,
California red-legged frog,
arroyo toad,
California jewelflower, California gnatcatcher,
California condor, ash-gray Indian paintbrush,
bird-footed checkerbloom, steelhead trout,
Santa Ana sucker and many more

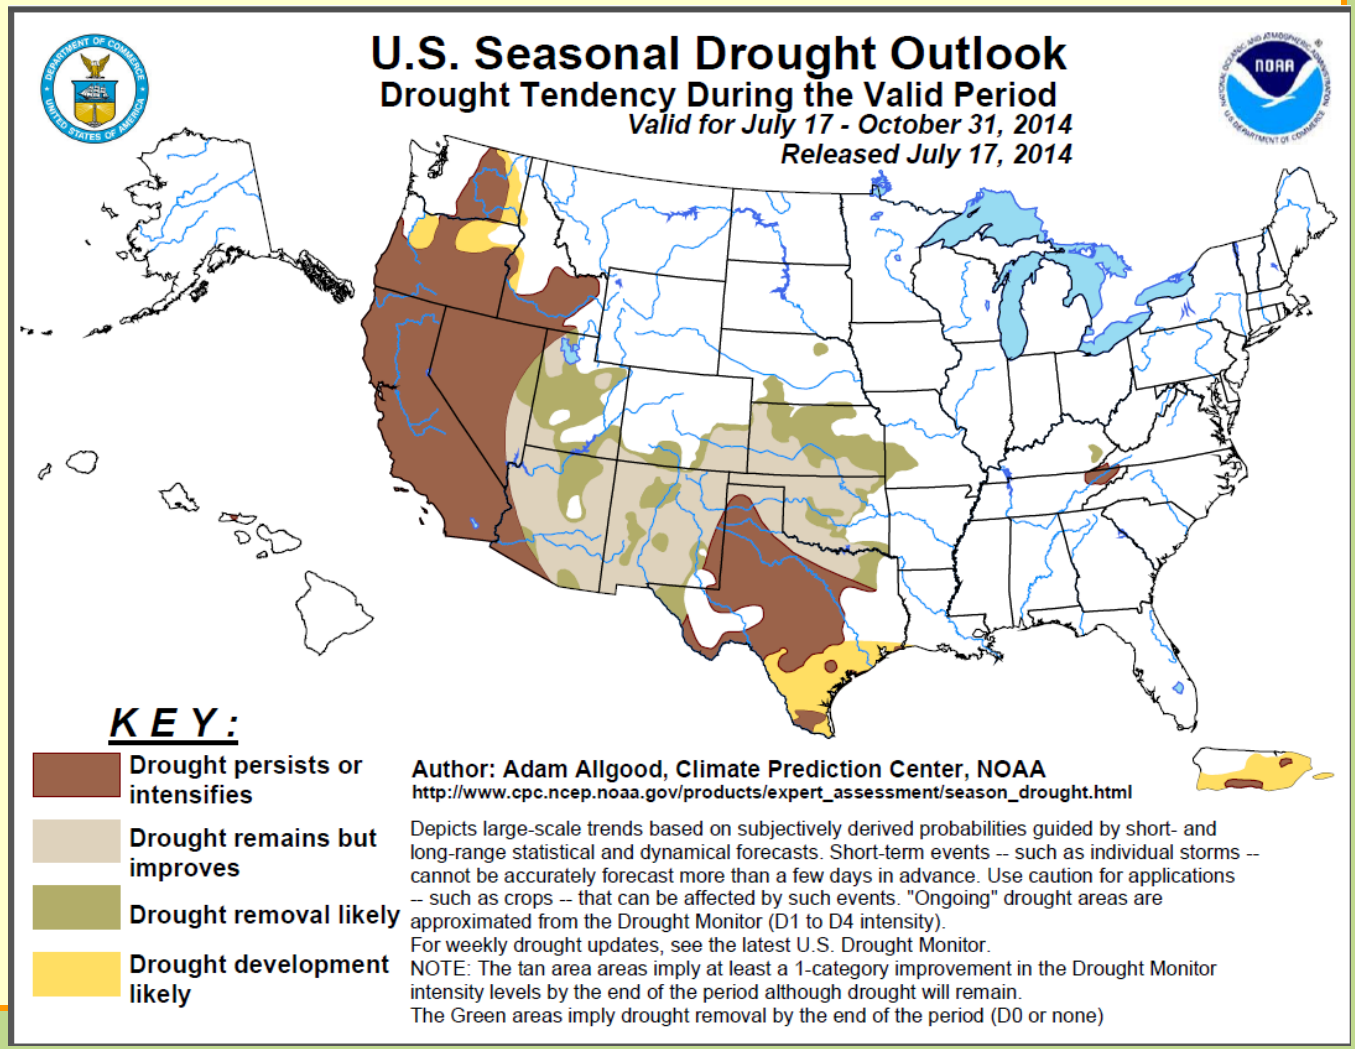
Climate & Climate Change

- 2014 is warmest year in 120 years of recordkeeping.
- CA's average temperature has been 4.6°F above average. That smashes the previous record by 1.4°F.

Los Angeles currently sees 23 days above 90°F. Increases to 41 days by 2050.

Climate Central.org



Sea Level Rise

- 6 inches within 20 years, and 3 feet or more by the end of the century
- Loss of approximately 23% of freshwater marshes (by 2100)
- A slight gain of salt marshes because freshwater marshes and swamplands convert to salt marshes when inundated.
- Beaches?

Southern CA Ecosystems – Fire and Climate Change

- Fire is an essential ecosystem process in many southwestern forests.
- Fire prone forests are likely to become more flammable with climate change.
- Restoring fire may facilitate climate change adaptation.

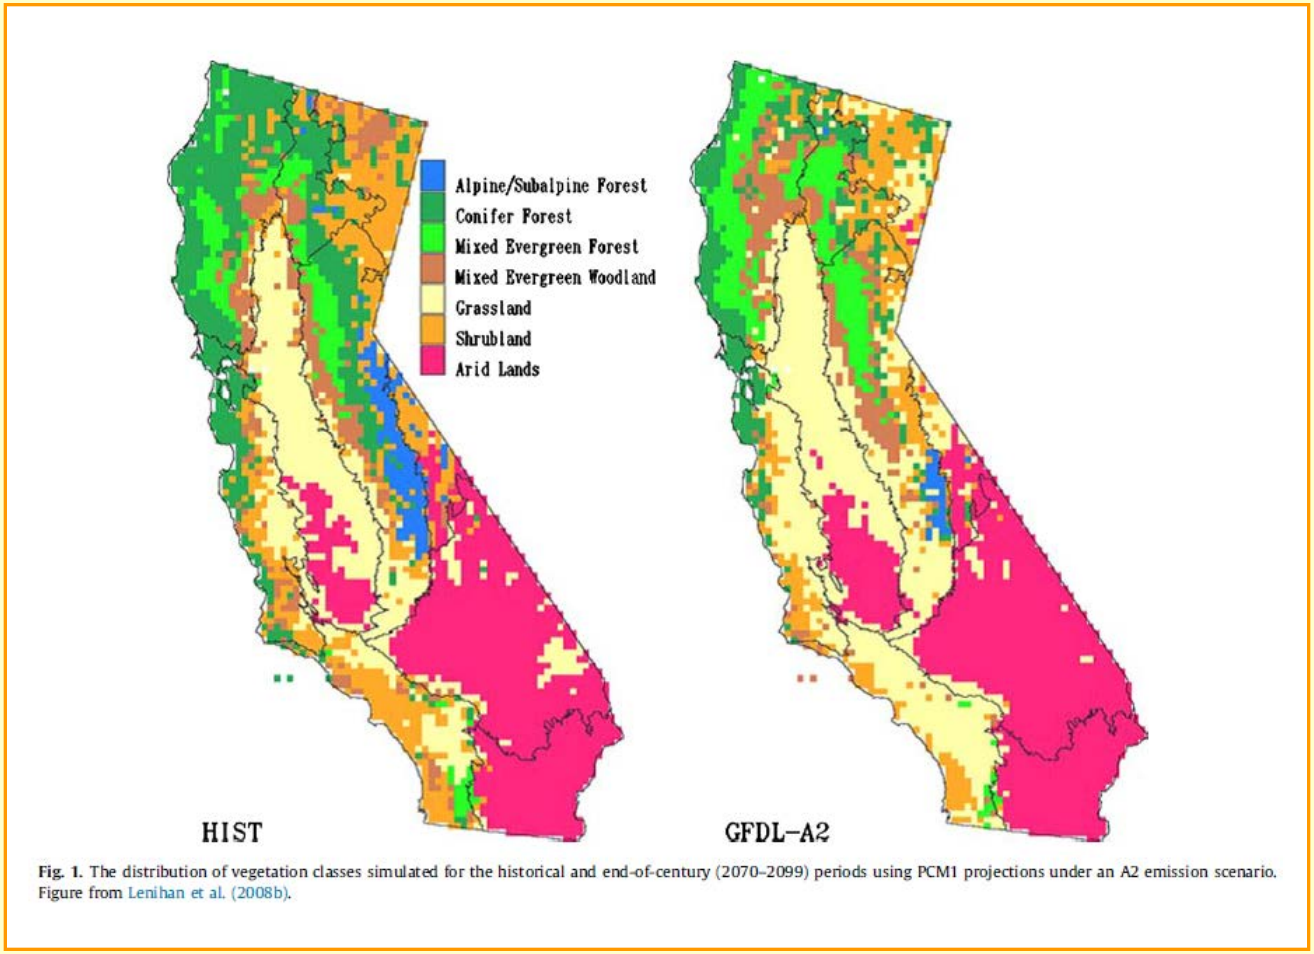

Fig. 1. The distribution of vegetation classes simulated for the historical and end-of-century (2070–2099) periods using PCM1 projections under an A2 emission scenario. Figure from Lenihan et al. (2008b).

MD Hurteau, JB Bradford, PZ Fulé, AH Taylor, KL Martin. 2014. Climate change, fire management, and ecological services in the southwestern US. Forest Ecology and Management. 327 (2014) 280–289

In 1980 the largest wildfire was about 50,000 acres over 3 weeks of burning. Now we're seeing 40,000, 50,000, 60,000 acres burned in a day. – Tom Swetnam, Univ. Of Arizona

There is no doubt that there were fires with significant acreage loss in years prior to 1932, but those records are less reliable, and this list is meant to give an overview of the large acreage-loss fires in more recent times. (Also note that this list does not include fire jurisdiction. These are the top 20 within the state, regardless of whether they were state, federal, or local responsibility.)

How will forests respond to climate change?

Photo: Craig Allen, USGS

Warming will

- - decrease snowpack,
  - cause earlier snowmelt,
  - increase summer evapotranspiration,
  - increase the frequency and severity of droughts,
  - increase risk of frost injury
  - change germination time
  - change time of bud set and bud break
