Re: EPA-HQ-OPP-2010-0889, Sulfoxaflor registration

This comment is being provided by the Western Integrated Pest Management Center in response to docket EPA-HQ-OPP-2010-0889 on sulfoxaflor. This comment includes information from California, Hawai'i and Guam. Additional comments will be provided from the subregional comment coordinators of the Western IPM Center. These comments address the use of sulfoxaflor in our states and territories and includes information about integrated pest management under the two proposed restrictions.

Integrated pest management (IPM) is a science-based, ecosystem level approach to pest management that identifies and reduces risks from pests and pest management practices using the most economical and environmentally responsible means possible. These comments are presented within the context of integrated pest management. Data from California are drawn from the California Department of Pesticide Regulation's pesticide use reporting system which is one of the most comprehensive pesticide use databases in the United States. Other data gathered on the use of sulfoxaflor and the IPM compatibility of the two proposed restrictions are from researchers, extension specialists, and growers in California, Hawai'i and Guam.

Use of sulfoxaflor in California

Sulfoxaflor was only registered for use in California for a short period of time. Thus, we do not have sulfoxaflor use data in our pesticide use reporting system. California extension educators and researchers provided information on the potential use of sulfoxaflor in the crops they work on. Their research and work with growers has shown that sulfoxaflor controls aphids and Lygus bugs in several crops. For example, studies on the effectiveness of sulfoxaflor in broccoli research trials show that it controls aphids (<http://ucanr.edu/blogs/blogcore/postdetail.cfm?postnum=9629>). The California researchers and extension educators have data showing that sulfoxaflor would also be a good fit in alfalfa.

It is disappointing to the researchers that the proposed changes will not include cotton and strawberries, two crops in California that are severely impacted by Lygus bugs. Because sulfoxaflor has a novel mode of action, having this chemical available for growers provides some level of resistance management. A best IPM practice when using pesticides is to use a range of modes of action to ensure that pests do not become resistant. Sulfoxaflor provides that and would be beneficial in crops with high aphid and plant bug pressures.

Comments on the potential use of sulfoxaflor in Hawai'i will be provided separately.

Proposed restriction on downwind 12-foot buffer when there is blooming border vegetation

An important part of integrated pest management is to manage beneficial insects and pollinators. By promoting the growth of nearby vegetation, growers are consciously creating biodiverse zones where

beneficial insects and pollinators flourish. We are concerned that this restriction would force growers into reducing the level of border biodiversity in order to use sulfoxaflor as part of an integrated pest management program. If this border vegetation were removed, growers would no longer have the ecological services provided by beneficial insects and pollinators. If growers kept the biodiverse borders and imposed the 12-foot buffer, it is possible that their unprotected crop would harbor the targeted pest, eventually resulting in the need for further pesticide use. This restriction should be researched more before implemented and that research should include studies on grower behavior under this restriction.

Proposed restriction on tank mixing

The data presented in this section are from California, Hawai'i and Guam. While some applications of tank mixing (such as the use of multiple narrow spectrum materials to achieve broad spectrum control of one pest) are not considered a part of integrated pest management, there are other strategies to tank mixing which fit nicely within an integrated pest management program.

Pesticide use reporting data show that many growers combine different types of materials (insecticides, fungicides, oils, adjuvants, plant growth regulators, drift reduction surfactants, etc.). In an integrated pest management program, tank mixing keeps costs lower by allowing growers to target multiple types of pests in one application. Integrated pest management strategies also include maintaining soil health. Fewer applications result in less compaction and improved soil health. Tank mixing also means that if a grower is faced with two pests and a limited application window they can control both pests with less risk.

Tank mixing is also important for resistance management. When controlling plant diseases, mixing two or more chemicals with different modes of action ensure that the plant pathogen is not being subjected to the same chemical and reduces the probability of resistance. Tank mixing of herbicides can provide specific control of many types of weeds and limit grower's need for a broad spectrum herbicide. Continued use of broad spectrum herbicides has been shown to select for herbicide tolerant and herbicide resistant weeds. Tank mixing of insecticides allows growers to target more than one insect pest.

Our data show that tank mixes are more complex than simply mixing two insecticides or two fungicides. Since data on tank mixing of sulfoxaflor were not available in California, we analyzed pesticide use reporting data in two ways. First, we gathered the overall rate of tank mixing in California. These data show that tank mixes are used 70 to 80% of the time (Appendix B). It is clear that many tank mixes include the addition of an adjuvant to make the pesticide more effective or to reduce drift and environmental harm. Further investigation into the data, however, indicate that growers are mixing at least three different materials together.

Since sulfoxaflor is similar to thiamethoxam and would be used to control the same insects in the same crops, we analyzed the tank mixes associated with thiamethoxam in California in 2014. Thiamethoxam was applied 25,382 times in 2014 and was used throughout the state on fruit and vegetable crops. It was applied mostly as Actara which is labeled for control of sucking and chewing pests. Thiamethoxam was part of a tank mix 77% of the time. Moreover, when mixed, it was often mixed with more than two other materials. The materials mixed with thiamethoxam include insecticides, surfactants, plant growth regulators, and fungicides (Appendix A).

We solicited input from extension educators, researchers, and growers on tank mixing in Hawai'i and Guam. We received the following comments:

- Tanking mixing a postemergent with a preemergent herbicide is an example of a good and effective strategy to use for long lasting control of weeds in Hawai'i. Saving labor and time (versus multiple applications) are the main reasons for tank mixing. Sources: Extension personnel with landscape, turf and production ornamental responsibilities, sites of application were not specified.
- Tank mixing pesticides is a common practice for golf courses and landscaping professionals. Saving labor and time are the main reasons for tank mixing. Source: Extension specialist with landscape, turf and production ornamental responsibilities.
- A macadamia grower with two separate orchards reported tank mixing for weed control: Gramoxone with Goal, and Roundup with Fusilade.
- One of the macadamia orchards mixes TriTek (mineral oil) with the IGR Esteem (Pyriproxyfen) for Macadamia Felted Coccid control.
- Seed crop producers report tank mixing insecticides with different modes of action and mixing fungicides with insecticides or foliar fertilizers. If these growers were unable to tank mix, they would need to make several spray passes. Thus tank mixing allows them to save fuel and minimize emissions. Source: seed crop producers.
- Tank mixing was reported when there are infestations of multiple pest species. The mixes may include pyrethrins, soaps, spinosad and other active ingredients. Source: Extension specialist with sustainable farming responsibilities.
- An Extension specialist and agent agreed that coffee growers benefit the ability to tank mix pesticides and other materials.
- Products which contain *Beauveria bassiana* were mentioned as components of some tank mixes. There is a pretty extensive list of compatible pesticides that can be tank mixed with *B. bassiana* products.
- Two food crop Extension agents were in agreement that option to tank mix was important in situations such as these:
 - A grower could tank mix an insecticide with a fungicide to control both insect pests and diseases in one application.
 - A grower may want to tank mix an insecticide which only controls immature insects (like an insect growth regulator) and with another insecticide that also controls the adult stage.
- A food crop Extension agent reported that her growers tank mix to minimize time and labor expenses.

Please contact me if further information is needed.

Sincerely,

Amanda Crump
Director, Western Integrated Pest Management Center
